FUNC	11	Bidirectional Room Operating Panel
TYPE	03	Type 0x03 (description: see table)

Submitter: Thermokon Sensortechnik GmbH

Data exchange

Direction: bidirectional (Smart-Ack)

Addressing: broadcast and addressed

Communication trigger: event- & time-triggered

Communication interval: time-triggered (configurable at the device) & event-triggered

Trigger event: keypress

Tx delay: -

Rx timeout: -

System Specification

Teach-in

Teach-in method: Smart-Ack teach-in without repeater

Security

Encryption required: no

Security level format: -

Product Description

The device represented by this EEP is a "Bidirectional Room Operating Panel with Display". It is powered by solar cell.

It may be equipped with the following features (for details please see the EEP-Family table below):

- Temperature Sensor
- Humidity Sensor
- Temperature Setpoint Adjustment
- Fan Speed Adjustment
- Occupancy-State Adjustment

For pairing the bidirectional "Smart Ack Teach-In without repeater" method is used.

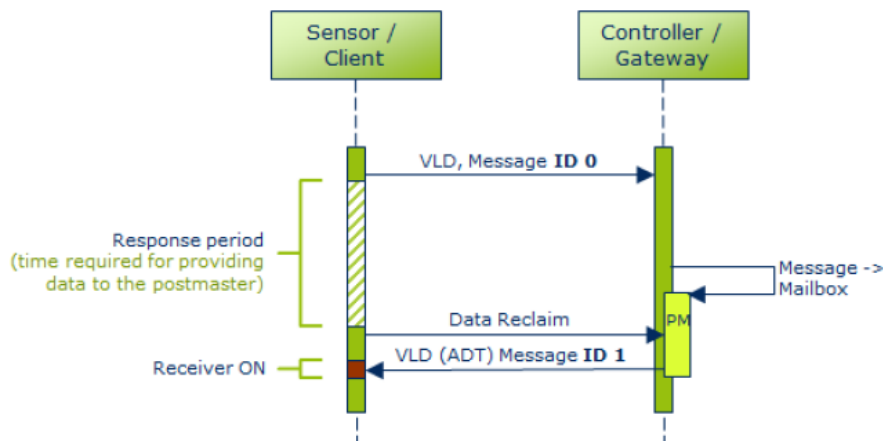

The device transmits the actual sensor values periodically (default: 1000 s) or on the event keypress.

Temperature Sensor, Humidity Sensor

The environmental sensors are updated periodically (adjustable, default: 100 s) and, if there is a change, the updated values will be send immediately.

The Smart Ack functionality will be used for setting display symbols like "window open, heating/cooling, occupancy state" or for overwriting parameters like setpoint, fan speed or occupancy state which are stored at the device.

Communication flow, triggered by a keystroke (first keystroke within inactive state, display state is off):

System Specification

System Specification

Communication flow, triggered by an event like temperature- and or humidity change or heartbeat:

Message type A / ID 0 (First switch press after sleep-mode, request new data)

Direction: Sensor -> Gateway

Bit 0.7 indicates which setpoint type is actual used at the device. The difference is made at the visualization of the setpoint (real temperature setpoint (24.5°C) or setpoint shift (+ 3.0°C)) and this information is needed for interpreting the value of DB2 at Message Type C (ID2).

Offset	Size	Data	ShortCut	Description	Valid Range	Scale	Unit
0	1	Setpoint type	SPT	Setpoint type actual used by the device (temperature correction / temperature setpoint)	Enum: 0: Temperature correction 1: Temperature setpoint		
1	3	Not Used (= 0)					
4	4	Message ID	MID	Message Type A, ID-0	Enum: 0: ID-0 1: ID-1 2: ID-2 3...15: Reserved		

System Specification

16	8	Basetpoint	BSP	Set basetpoint for visualization of the temperature setpoint	Enum:		
					0...14: Reserved		
					15...30: 15...30 °C		
					Reserved		
24	4	Valid temperature correction	COA	Set valid temperature correction	Enum:		
					0: Reserved		
					1: K		
					-1...1		
					2: K		
					-2...2		
					3: K		
					-3...3		
					4: K		
					-4...4		
					5: K		
					-5...5		
					6: K		
					-6...6		
28	3	Fan Speed	OFS	Override actual Fan Speed	Enum:		
					0: Auto		
					1: Speed 0		
					2: Speed 1		
					3: Speed 2		
					4: Speed 3		
					5...6: Reserved		
31	1	Occupancy State	OOS	Override actual Occupancy State	Enum:		
					0: State Unoccupied		
					1: State Occupied		
4	4	Message ID	MID	Message Type B, ID-1	Enum:		
					0: ID-0		
					1: ID-1		
					2: ID-2		
8	8	Temperature correction	OSO	Override Setpoint offset (linear, min. - ... max. +) (valid temperature correction)	0...255	according to COA	K

System Specification

System Specification

Message type C / ID 2 (Transmit actual data)

Direction: Sensor -> Gateway

Bit 5.7 indicates which setpoint type is actual used at the device. The difference is made at the visualization of the setpoint (real temperature setpoint (24.5 °C) or setpoint shift (+ 3.0 °C)) and this information is needed for interpreting the value of DB2.

Byte 4 transmits the actual measured temperature.

Byte 2 transmits the actual setpoint shift. How to interpret this value is a combination of Bit 5.7, Byte 1 and Bit 0.7 ... 0.4.

If the actual setpoint type is setpoint shift, then the value of Byte 2 only represents the scaled valid setpoint shift at Bit 0.7 ... 0.4.

If the setpoint type is temperature setpoint, then the temperature setpoint is calculated as sum of the internal basesetpoint at Byte 1 and the scaled valid setpoint shift at Bit 0.7 ... 0.4, transmitted at Byte 2.

Byte 1 transmits the actual, at the device stored, basesetpoint.

Bit 0.7 ... 0.4 transmits the actual valid, at the device stored, setpoint shift.

DB Bit Bit Offset	DB_5								DB_4								DB_3								DB_2								DB_1								DB_0															
	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
